SECRET Security Information

PROJECT No. 7002

SOVIET STOCKPILES OF COMBAT SUPPLIES

I. STATEMENT OF THE PROBLEM

1. To prepare a listing of Soviet military supply installations within the USSR, East Germany, the Soviet Occupied Zone of Austria, and the European Satellites -- Hungary, Poland, and Rumania.

II. FACTS BEARING ON THE PROBLEM

2. Intelligence on Soviet military supply installations is fragmentary. Assessment of the accuracy of the reports received on supply installations can, at best, be only approximate. Practically all the information comes from refugees from behind the Iron Curtain and from repatriated PW's. These are not trained observers and naturally vary in sense of direction, ability to estimate distances and measurements, and capacity to remember details after the passing of time. Moreover, refugees show a decided tendency to exaggerate the importance of the installation on which they report. In many cases it is difficult, if not impossible, to determine whether the several sources reporting the existence of an installation in a given locale are reporting on one or more installations.

3. Only within East Germany have sufficient reports been received to permit the determination of a pattern for Soviet supply installations. And even in these reports, it is often impossible to determine whether the subordination of a reported installation is Soviet or German. For this reason, all ammunition and POL dumps have been considered to be Soviet.

4. Reports on storage facilities in the USSR do not always distinguish between military and nonmilitary industrial and state-controlled communal installations. It is highly probable, therefore, that some of the dumps and depots listed in TAB "C" (European USSR) and TAB "D" (Asiatic USSR) are nonmilitary.

5. So far as known, there are no Soviet-controlled supply installations in Bulgaria and Czechoslovakia. In Hungary, Poland, and Rumania, however, the Soviets maintain complete control over a number of supply installations

and a conjunctive control with these countries over certain other supply installations. The listing includes both categories.

6. It is known that the Soviets normally maintain a high level of supplies within their key logistic installations. There have been reports that stored supplies are consumed so as to provide rotation of supplies within dumps and thus prevent deterioration. This rotation may in part explain the frequent reports of moderate traffic moving into and out of supply installations.

III. DISCUSSION

7. See the following TABS:

- TAB "A" - Stockpiles of Soviet Combat Supplies in East Germany, Nos. 1-207.
- TAB "B" - Stockpiles of Soviet Combat Supplies in the Occupied Zone of Austria, Nos. 208-262.
- TAB "C" - Stockpiles of Soviet Combat Supplies in European USSR, Nos. 263-575.
- TAB "D" - Stockpiles of Soviet Combat Supplies in Asiatic USSR, Nos. 576-729.
- TAB "E" - Stockpiles of Soviet Combat Supplies in Hungary, Nos. 730-756.
- TAB "F" - Stockpiles of Soviet Combat Supplies in Poland, Nos. 757-805.
- TAB "G" - Stockpiles of Soviet Combat Supplies in Rumania, Nos. 806-839.
- TAB "H" - Tabulation of Installations by Type of Supplies Stored.

SECRET Security Information

PROJECT No. 7002

SECRET Security Information

✓ IV. CONCLUSIONS

8. It appears that the Soviets have undertaken a massive build-up of supplies in widely dispersed localities to reduce the strategic vulnerability of their logistics system. During World War II, large-scale logistics build-ups, especially of ammunition and POL close to the front-line areas, were characteristic of all Soviet military operations. An evaluation of currently identified Soviet dumps and depots indicates that the system has in fact been expanded since World War II.

9. More than 200 supply installations in East Germany have been identified. These, in general, are located along good routes to the west from the

Soviet Union. Apparently, Berlin, Magdeburg, Schwerin, the training area around Dessau, the Erfurt area, and the Riesa-Dresden area are supply centers, probably because of existing transportation and troop installations.

10. Most Class I, II, and IV dumps in East Germany are located in or near heavily populated areas immediately adjacent to rail transfer points. Most Class III and V dumps are located in forests, abandoned German barracks, and other unpopulated areas, but near rail and highway lines.

11. About 30 per cent of the fuel dumps in East Germany are partly underground. Half of the remaining 70 per cent are open storage dumps, the majority of which apparently are suitable for immediate use.
